

Tri/Quadpod Braces

Tripods and Quadpods need to be braced correctly to secure them and make a sturdy structure. For tripods, the braces should be lashed around all three sides. If one of these structures is braced by other parts of the gadget, then this may suffice.

With quadpods, diagonal braces should be used, preferably low to the ground. The main point is that all of the legs are secured.

Remember to design and build your gadgets with safety in mind.
